

Dehydrated Alfalfa Pellets

Qualities

Once the alfalfa has been dehydrated, it is ground by compression to obtain a very compact product that does not give off dust when handled.

The diameter of the pellets ranges from **5 to 13 millimetres**. The format and low moisture content (10% approx.) of these dehydrated alfalfa pellets **guarantee a feed that offers excellent digestibility, maximum appetite, and the use of all their nutritional components.**

There are **three** qualities of pellets:

	Protein	RFV	Moisture
Extra Quality	>18%	>150	<12%
First Quality	16-18%	130-150	<12%
Second Quality	<16%	110-130	<12%

In addition to these classifications, Spanish companies can also produce other qualities or mixtures upon request.

Our pellets are **100% natural** and suitable for all types of animals and are especially effective in the diets of goats, lambs, sheep, rabbits, and pregnant sows.

Size and Weight:

The pellets can be purchased in:

25 kg sacks

BigBags
